Populations and capability under three disclosed scenarios (a = 0.5)
Human population $H(t)$ (billions of persons)
time (years)
A: low RSI growth
B: moderate RSI growth
C: rapid RSI / automation
Installed hardware $A(t)$ (hardware units)
Capability index $q(t)$
Automation fraction $\zeta(q(t))$
Every numerical parameter is a scenario assumption, not a measured RSI parameter. Panels use separate axes and units.
